Adding Brake Link Seals

The addition of U-Cup seals (1) to the rear Gemini DH brake link arm assembly can reduce noise caused by vibration (rattle) and can extend bearing (4) life.

To install, remove the bolt (5) and slide the link assembly down out from the carrier (6). Wipe the bearing (4) clean and cover it with some bearing grease to help prevent water intrusion. Position the small spacers (3) against the bearing followed by the seals with the open side (a) facing the bearing. Reinsert the link end with seals between the carrier and tighten the bolt.
